

The critical task of backing up and protecting valuable data on desktops and laptops can be a challenge. These days, because of an increasingly mobile workforce, many desktops and laptops live outside of secure corporate networks. Yet, most of a company's critical files are stored on employee desktops and laptops, which are especially susceptible to risk, including hard drive failure, theft, accidents and cybercrime. Many businesses lack a comprehensive data backup protection policy. Many other businesses simply fail to backup desktops and laptops at all.

Failure Rates

According to Statista, around 7% of laptops fail in the first 12 months. However, after 36 months laptop failure rate climbs alarmingly to 31%. What's more, some backup solutions disrupt user productivity, lack security, leave your devices vulnerable to data loss, and offer no centralised management.

Backup When You Need IT

Modern Networks desktop backup protects your critical data by encrypting selected files and sending them to the Cloud for secure access and recovery when needed, all through a web-based, multi-tenant administrator's console for complete control and customisability. Modern Networks makes backing up and restoring data for Windows and Mac computers simple to manage and easy to use. Your data is saved automatically in a constant stream. Multiple levels of redundancy mean that we hold multiple copies of your data in different locations to ensure it's always recoverable.

Security First

Your data is encrypted in transit and while at rest in the Cloud. Our secure data centres employ the highest protection standards, including state-of-the-art security with 24x7x365 onsite monitoring.

24/7 Support

As part of a fully managed IT solution, Modern Networks has got you covered with 24/7 technical support. Our UK Service Desk provides immediate 1st and 2nd line technical support by email and telephone. We are a Gold member of the Service Desk Institute and offer you ITIL best practice standards of IT support. ITIL is the most widely accepted approach to IT service management in the world.
