

# Backup & Disaster Recovery

## Backup Your Entire IT Environment

Your IT environment is one of your organisations most valuable assets. Everything from cybercrime to severe weather incidents are on the rise. Ransomware attacks alone have doubled in frequency, from 13 percent to 27 percent, with incidents like WannaCry and Petya affecting thousands of targets and disrupting public services and large corporations across the world\*. That's why your business needs a single cross-platform solution that protects the entire IT environment.

Modern Networks provides backup and disaster recovery, data protection, and managed system migration for Windows and Linux systems on virtual and physical machines. If you're working in a mixed environment (Windows and Linux), you'll likely appreciate being able to run one backup and recovery software solution on all machines.

### **Backup**

Capture everything—systems, applications, configuration settings, services, data—so you never have to risk losing irreplaceable data, custom applications, or your operating system.

### **Schedule**

We can regularly run backups in the background while your staff are working (they'll never notice). You'll never risk losing more than a few minutes of data.

Modern Networks

Call 01462 426500 or visit [www.modern-networks.co.uk](http://www.modern-networks.co.uk)

## **Tests**

We can run tests on your backup images to ensure they are in a good state for fast, reliable recovery of all your data should a disaster strike.

## **Recovery**

Recover a file, folder or restore a whole system fast, to the same or different hardware, and so avoid downtime, lost business and all the associated costs.

## **Migration**

We can move a system to a new machine without losing data, uptime, and do it regardless of your new hardware choice.

## **Remote Monitoring & Backup Management**

Modern Networks actively monitors all backups under our control. We regularly check and manage backup files to ensure they remain in a good state. We can replicate backups to local, network and offsite locations, such as a secure third party data centre. This last option is useful where a site-wide failure or regional disaster might occur. We can remotely push new installations and pull regular status reports of the disaster recovery IT environment, should you need them.
