

Buy or lease your next business computer?

As a Building Manager or Facilities Manager in the commercial property sector, you are always juggling priorities and trying to squeeze the last drop of value from your limited budget. Keeping on top of a hundred and one tasks requires you have a decent, business-grade computer. However, the costs of a new computer, software licences, backup and support can mount up. So, what are your options?

Fight a losing battle

Does your computer take ages to start? Does it run at a snail's pace? Does it crash frequently and fail to save hours of precious work? Unfortunately, after 3 years most computers start to lose a little speed and performance.

Cheap is cheap

Of course, you could simply buy a cheap home computer as a replacement. After all, business-grade computers can be expensive. Business computers are built to last, with higher quality components that are tested more rigorously. They also come with the latest professional operating systems rather than inferior home editions.

Failure is an option

Home computers have an alarming failure rate. Around 3% are dead out-of-the-box. Another 5% will fail within a year. However, around 40% will fail in the second year. Around 5% of business-grade computers will fail in the same period.

Minimal support

Finally, business computers come with far better support than consumer devices. You won't have to queue in the local PC World while a part-time sales assistant tries to diagnose the problem, for example.

Desktop solutions

Modern Networks provides the latest business-grade desktops and laptops for a predictable, affordable fixed monthly subscription fee. Depending on your needs you can go for straight leasing or the managed service option, where we take care of support, backup and security.

Call your Modern Networks sales representative now for a chat about your needs and options.
